

The Marketing Engine

A complete marketing solution for your business — built on your own data, with revenue impact you can see and verify

Vinayak Business Brain · internal working document · July 2026

The idea in one paragraph

For a manufacturer, marketing is not ads or social media - their buyers are dealers and businesses they already know. Marketing here means one thing: **systematically extracting more revenue from the customer base they already have**. Their own invoice history quietly knows who buys on what rhythm, who has gone silent, who buys product A but never tried product B, and which stock the season is about to demand. Nobody reads that notebook. Our four engines read it every morning and turn what it says into owner-approved messages - each one measured against a hold-back group so the revenue we cause is proven, not claimed.

Revenue = customers x order frequency x order value. Every engine below defends or grows exactly one of those three levers.

Live numbers from kbrushes (July 2026): 32 active customers · 124 SKUs, average customer buys only 6.4 of them · 7 customers have a measurable buying rhythm and **6 are past their reorder window today** · 15 customers silent 60+ days, including one worth Rs 21L lifetime (silent since 31 March).

A note on the promise: we pitch "provably increases revenue - we show you the number" rather than "definitely". A guarantee invites argument; a measured number ends it. The hold-back method on the last page is what lets the owner verify every rupee we claim.

Engine 1 — Reorder Radar

Defends ORDER FREQUENCY - the skipped cycles nobody notices.

Every regular buyer has a rhythm, and a broken rhythm is invisible at every individual step: a 35-day buyer slipping to 45 days alarms no one, but it is 10 orders a year becoming 8 - a 20% cut from that account with zero drama. Worse, a skipped cycle is often a competitor's trial order; the window to interrupt that new habit is one cycle wide. The radar computes each customer's own median gap (and per-product gaps) and flags anyone more than 1.5x past it, the same day.

Trigger	Daily scan, automatic
Audience rule	Customers with 4+ orders and a stable rhythm; days-since-last-order > 1.5 x their own median gap. Per-SKU variant catches "still buys from us, stopped buying THIS item" - quiet share-of-wallet loss.
Message	Personal nudge listing their usual items and last order - never generic blasts
Human gate	Owner approves every message (batch approve, edit any, reject any)
Success metric	Skipped cycles recovered per month · Rs value of nudged orders
Live today	6 of kbrushes' 7 rhythm-regular customers are past their window right now

Owner effort: ~2 minutes a day. The radar never sleeps, never forgets, never spams (caps enforced in code).

Pitch line: "Your regular buyers forget. We remember for them - the same day, with their own order history in hand."

Engine 2 — Win-Back

Defends CUSTOMER COUNT - recovering relationships that leaked away in silence.

B2B churn has no event. A dealer never cancels; he just stops calling, and absence generates no paperwork, so nothing forces the owner to notice. kbrushes has 15 lapsed accounts today - nearly a third of its book - including a Rs 21L-lifetime relationship silent since March. Nobody decided to lose these customers; the loss is happening by default. Win-back is the cheapest revenue in commerce because every acquisition cost is already sunk: one well-timed, well-informed message versus months of sales visits for an equivalent new account.

Trigger	Weekly scan
Audience rule	Silent longer than $\max(2 \times \text{own median gap}, 60 \text{ days})$. Ranked by trailing-12-month revenue $\times$ recency decay - a Rs 21L customer silent 3 months outranks a Rs 50K customer silent a year.
Message	Relationship tone, references what they used to buy; any incentive is typed by the owner - the system never invents discounts
Human gate	Owner approves each; can add a personal line for big relationships
Success metric	Customers reactivated · their revenue in the following 90 days
Live today	15 lapsed accounts; top three worth Rs 21L, Rs 5.9L and Rs 3.6L lifetime

Reactivation is asset recovery: the relationship, credit history and onboarding are already paid for.

Pitch line: "A third of your customer book has gone quiet. We bring them back - politely, one approved message at a time."

Engine 3 — Cross-Sell

Grows ORDER VALUE - capturing wallet share the dealer gives to competitors by default.

The average kbrushes customer buys 6.4 of its 124 products. The rest of his requirement is bought somewhere - often only because he doesn't know the full catalogue. The co-purchase pattern across customers ("buyers of A almost always also use B") is the closest thing to a sales insight the data can generate by itself, and in B2B it lands well: consolidating suppliers means one delivery, one credit line, one relationship. This engine finds every customer who buys A but never tried B, for the strongest A-to-B patterns in their own market.

Trigger	Monthly scan (patterns move slowly)
Audience rule	Customer buys A (2+ orders), never bought B, where lift(A->B) >= 2 across the customer base and at least 3 customers support the pattern
Message	Specific suggestion with the reason ("most PA-14 buyers also take the 2-inch handle") - never a catalogue dump
Human gate	Owner approves; can veto product pairs that don't make trade sense
Success metric	New product lines added per customer · Rs revenue in promoted categories
Live today	124 SKUs, average basket 6.4 - the widest untapped lever in the data

With 32 customers, v1 works at category level (15 categories); SKU-level precision comes as the base grows.

Pitch line: "Your customers already trust you. We show each one the two products they're buying elsewhere."

Engine 4 — Stock & Season Push

Grows **ORDER VALUE** and frees **TRAPPED CAPITAL** - selling what the warehouse needs moved.

Dead stock is money frozen on a shelf (the finance dashboard already flags it). This engine turns that flag into a revenue action: match every slow item to the customers who historically buy its category, and put an owner-priced clearance or pre-season offer in front of exactly them. Seasonal pushes work the same way once 12+ months of history accumulate (or from the owner's declared season calendar until then).

Trigger	Monthly, plus pre-season windows from the business profile
Audience rule	Customers with past purchases in the pushed category, weighted by recency and volume
Message	Concrete offer on named items; price/discount always set by the owner
Human gate	Owner sets the incentive and approves the batch - the system never discounts on its own
Success metric	Dead-stock value cleared · Rs revenue from push campaigns
Live today	Dead-stock list already live on the dashboard - this engine gives it hands

Double win: a finance problem (frozen capital) becomes a revenue action - both numbers improve on the same dashboard.

Pitch line: "That stock sitting since March? We know which eight customers buy exactly that - let's ask them."

The proof layer — how every engine earns trust

Every marketing claim in history meets the same fair objection: *"they would have ordered anyway."* The answer is built into every campaign: we deliberately hold back a random 20% of each audience and message the other 80%. The revenue difference between the two groups is - by construction - the revenue the messages caused. We report both numbers, always: raw ("Rs 11.4L ordered by messaged customers") and incremental ("about Rs 6.2L would not have come without the nudges"). The second number is the product.

Honesty at small scale: with ~32 customers early results carry error bars; proof strengthens with every customer onboarded.

What the owner sees each month

One page: messages approved (34) -> customers who ordered (19) -> raw revenue (Rs 11.4L) -> incremental revenue (Rs 6.2L) -> best engine this month -> next month's suggested audiences. This page is also the sales deck for the next customer: no testimonial, just a number another owner can verify against his own books once he onboards.

Rollout & prerequisites

Step	What	Time
1	Contact capture: emails/WhatsApp for ~34 customers (accountant task, one sitting) - the single hard prerequisite; TranzAct stores no contact data	30 min
2	Engines 1 + 2 live on email, owner approving every message	Week 1-2
3	First monthly report with hold-back proof	Week 6-8
4	WhatsApp channel (Business API + DLT registration - start paperwork now)	2-4 wks lead
5	Engines 3 + 4, tone earned autonomy for routine nudges	Month 3

The combined pitch: "A complete marketing department for your business, running on your own data. It watches all 32 of your customer relationships the way you can only watch your top five, it never sends a rupee figure it can't prove or a message you didn't approve - and every month it shows you, with a hold-back comparison, exactly how much revenue it caused."
